

Frost Zone Split (%)

Some parts of your farm carry a higher frost risk than others — typically low-lying areas where cold air settles. These frost-risk areas can exist in multiple paddocks, not just one, and often make up only part of a paddock rather than the whole thing.

You may want to manage these areas differently — for example, sowing a more frost-tolerant crop there, or avoiding a particular crop in that area altogether.

How the tool uses this

The tool splits your cropping area into three frost-risk zones:

- **Green** — low frost risk
- **Amber** — moderate frost risk
- **Red** — high frost risk

Enter the percentage of your total cropping area that falls into each zone — these should add up to 100%.

You can also specify one crop that should not be grown in the Red zone — the highest frost-risk area — and the tool will avoid sowing that crop there when building the sowing plan.
